August 24, 2015

Hello:

My name is Jay Ravaliya and I'm very excited to be considered for an internship at your organization. I am currently a Master's Candidate in Computer Science at the New Jersey Institute of Technology and have earned a Bachelor's Degree in Biomedical Engineering at Rutgers, the State University of New Jersey.

I've recently decided to go back to school to study Computer Science, after realizing that I needed to convert my passion since high school into a career. While I officially begin school this fall, I'm excited to represent many accomplishments thus far:

- Published two iOS apps to the Apple App Store, written in the Swift programming language.
- Became comfortable with Object Oriented Programming in Python.
- Wrote a RESTful API consumed by one of my iOS apps, and created a registration process for third party folks to securely use and consume the API.
- Built a web application using Python's Flask micro framework, backed with MySQL and interfaced with the SQLAlchemy Object-Relational Model (ORM). Frontend built with Bootstrap.
- Wrote two PHP web applications as assignments for Harvard University's CS50 - Introduction to Computer Science class: a virtual stock exchange website and a mashup between Google Maps API and Google News API.
- Won "Best Myoband Hack" at Angelhack Manhattan 2015 and won "Best Social Innovation Hack" at the University of Pennsylvania's prestigious PennApps Hackathon 2015.

I'm certainly passionate about a future in Software Engineering, and I hope to learn what it takes to support a large-scale technical infrastructure through an internship opportunity

Previously I worked at two Fortune 500 companies, PepsiCo and L'Oreal USA. At PepsiCo, I filled a brand new role responsible, Supply Chain Analyst, for building high performance Excel VBA applications for over 100 employees to use daily across North America. I introduced our teams to the power of writing code to solve day-to-day problems that changed the way we worked on a day-to-day basis. Some accomplishments include:

- Reducing time taken to execute my role from 40 hours per week to 6 hours per week.
- Writing an algorithm to emulate a regular employee task, which reduced the time effort of the task from 25 hours per week to 8 minute per week, a 99.46% efficiency!

I also worked at L'Oreal USA, where I managed three global Contract Manufacturers and oversaw 1,000,000 units of production per month – talk about complexity!

I appreciate the time taken to review my credentials – be sure to visit my website where you'll find more details regarding the discussed projects, links to my GitHub and LinkedIn, and more! I look forward to hearing from you – thanks!

Best,

Jay Ravaliya
